General Functions of Urinary System

- **Urine production**
 - **Remove** metabolic wastes from blood **by filtration**
 - **Regulate** the balance between water and electrolytes **by**
 - **Re-absorption of water and electrolytes selectively**
 - **Excretion of urea, uric acid, creatinine etc.**
- **Secretion of certain enzymes or cytokines**
 - **Renin**: to regulate **the blood pressure**
 - **Erythropoietin**: to stimulate **RBC production**

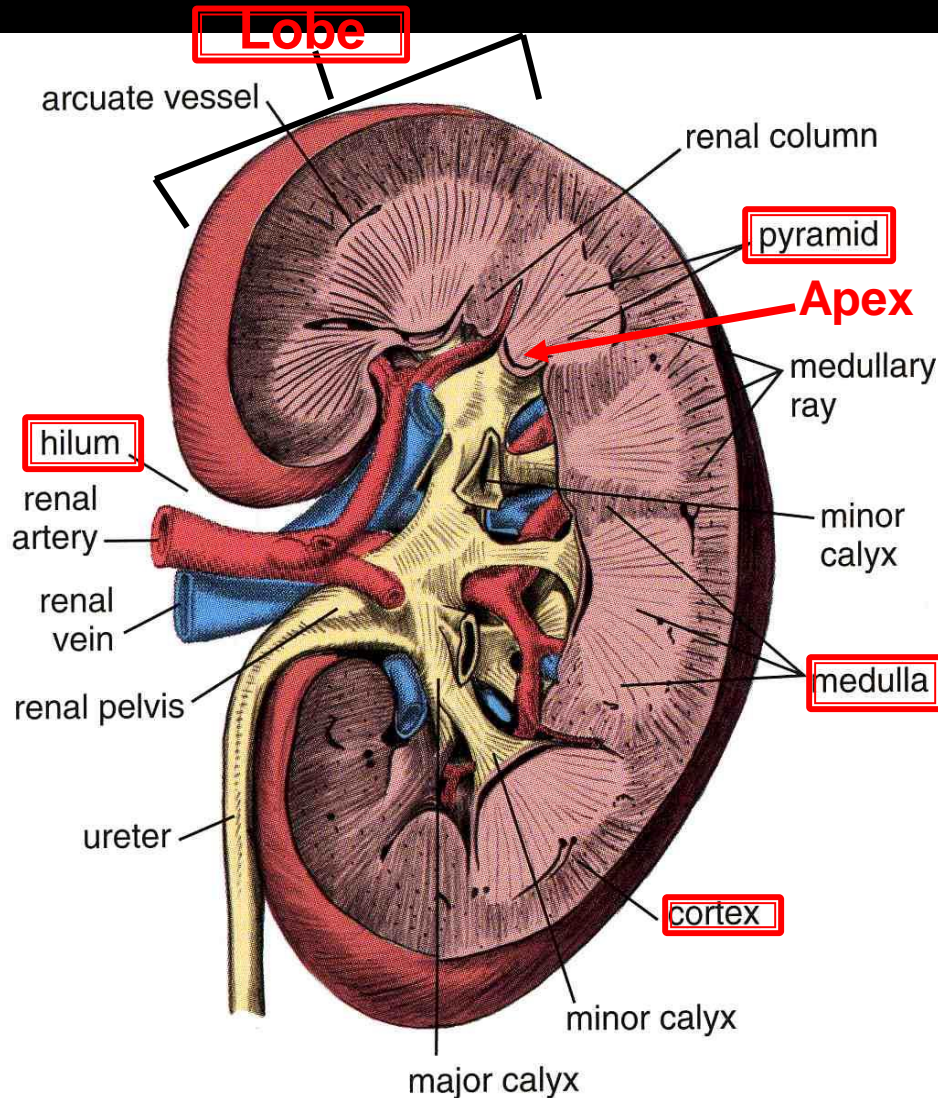

Objectives

- **Kidney**
 - **Structure and function of**
 - **Nephron and uriniferous tubule**
 - **Filtration barrier**
 - **Podocyte and mesangial cells**
 - **Juxtaglomerular complex**
- **Ureter**
- **Urinary bladder**

General structure (1)

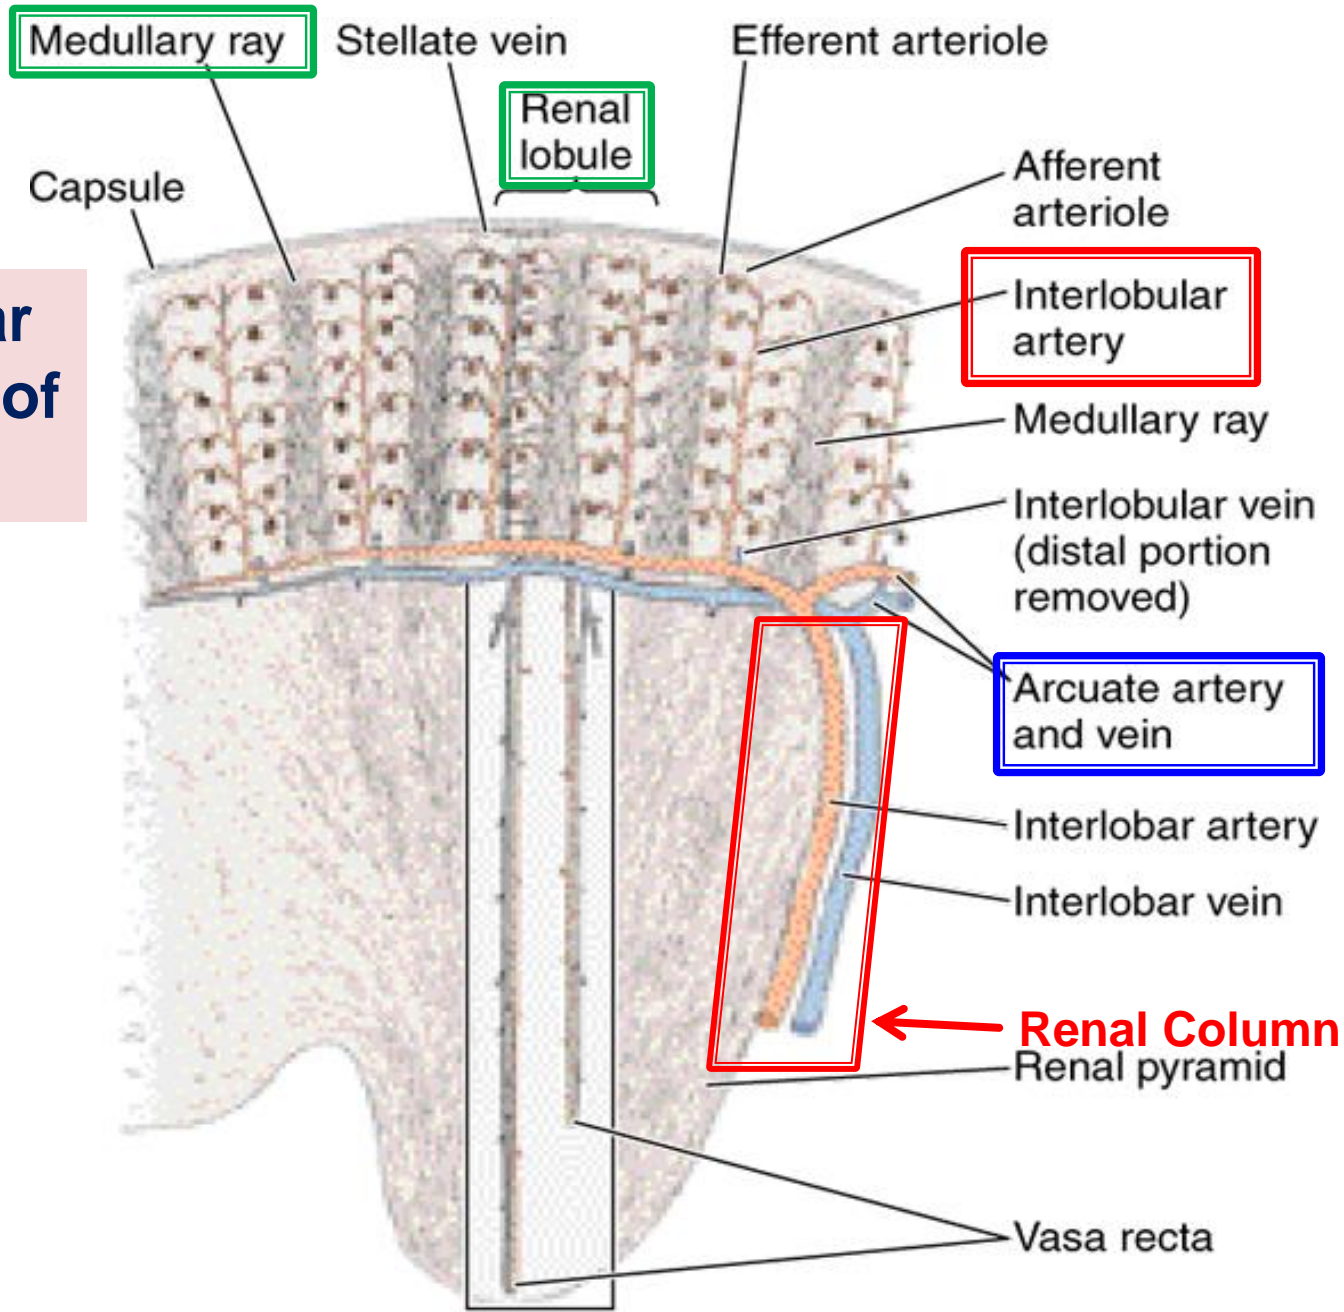

- **Hilum:** vessels, ureter-renal pelvis, major and minor calices
- **Capsule:** collagen
- **Lobes:** 8-18 each
- **Cortex:** darker, more "granular", renal corpuscles
- **Medulla:** paler, renal tubules but not renal corpuscles; vasa recta
- **Pyramids:** part of medulla, base is closely adhered to cortex, rounded apex [papilla] towards minor calyx

General structure (2)

- **Medullary rays:** striations of medulla extend into cortex, collecting tubules/ducts, PST, DST(TAL).
- **Renal columns:** cortical tissue extending into medulla, usually between lobes
- Major vessels, via renal columns into kidney

Vascular Supply of Kidney

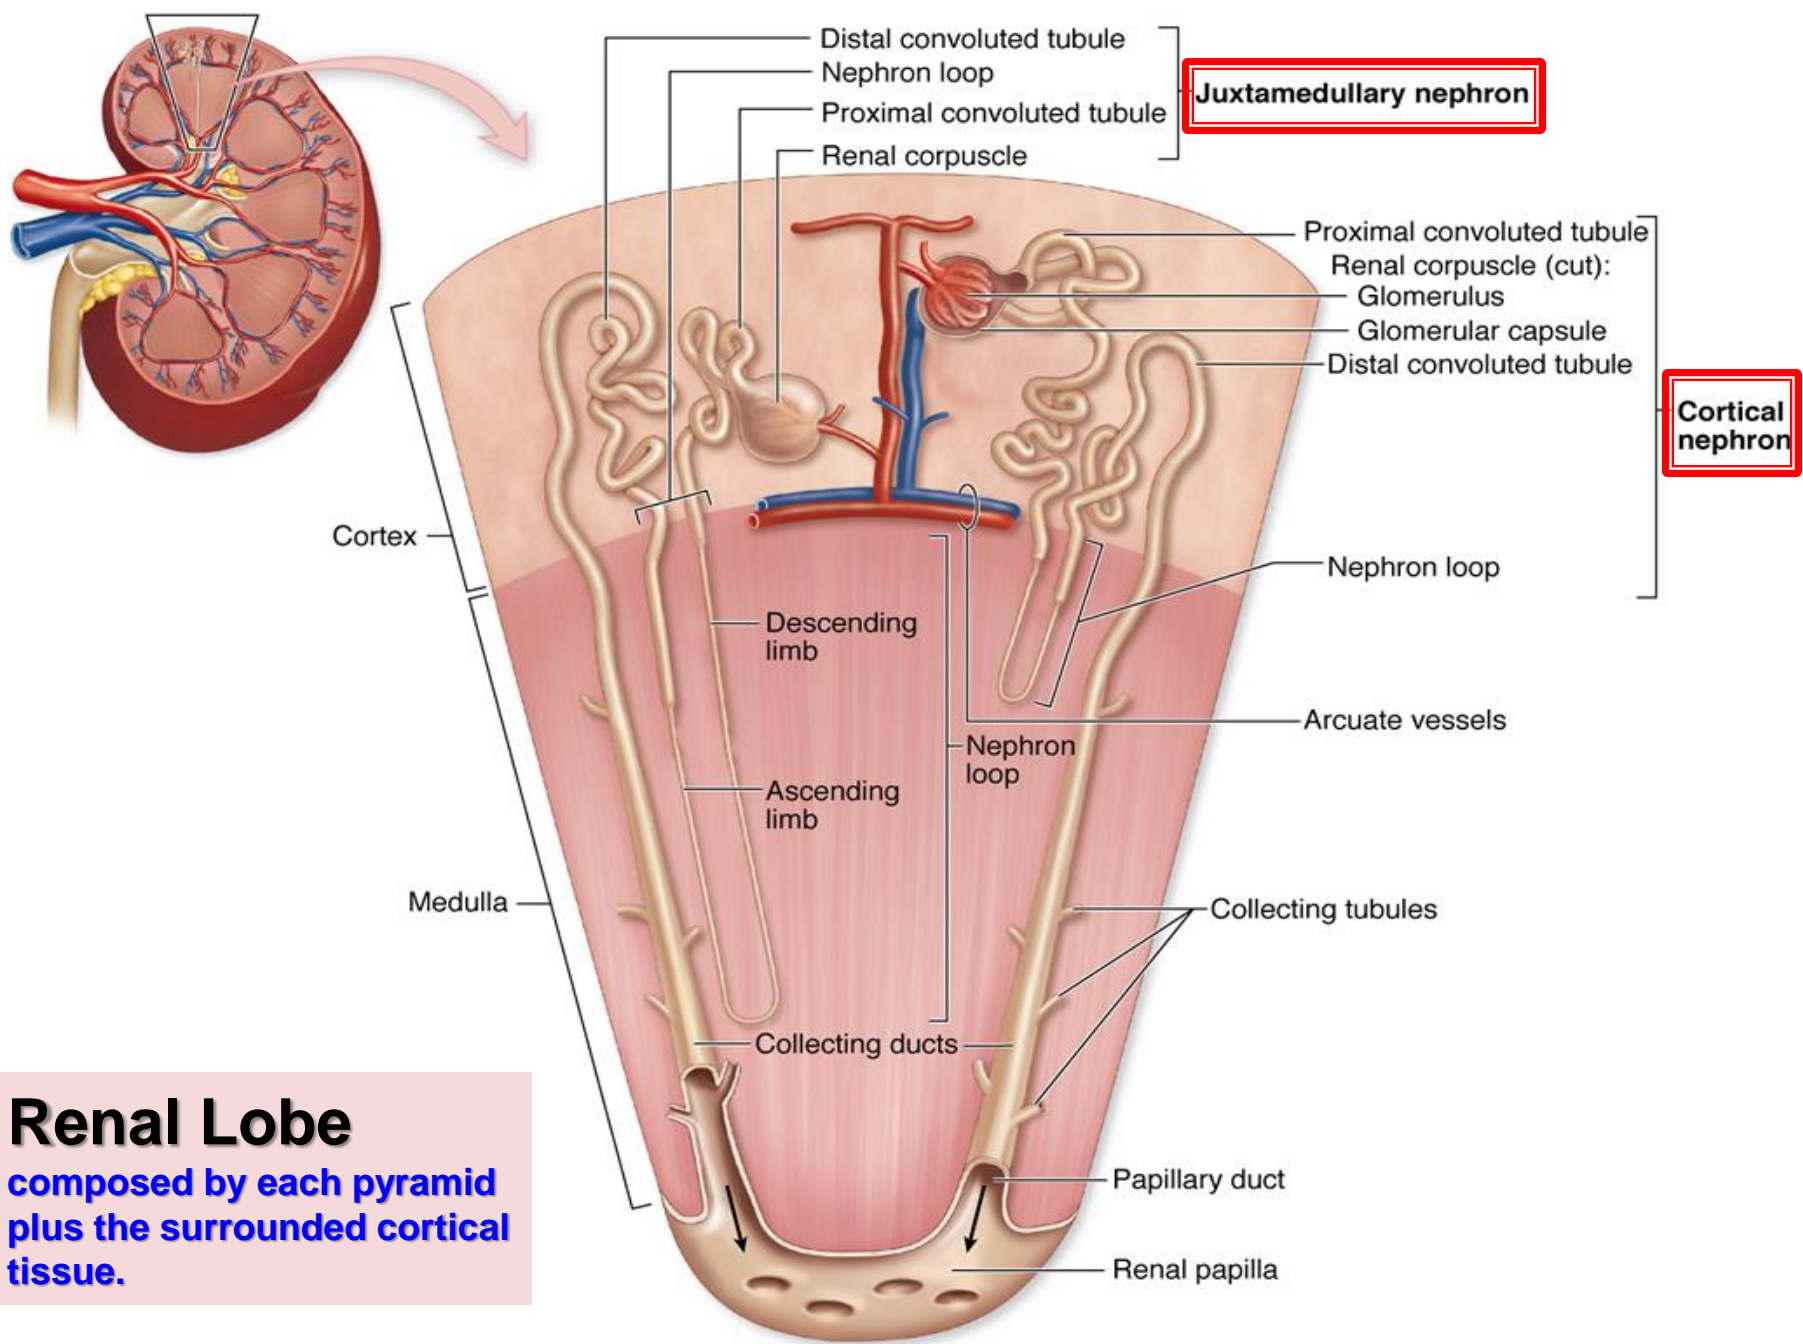

Vascular Supply of Kidney

Microvasculature of the renal cortex

- **G: glomerulus**
- **A: afferent arterioles**
- **I: interlobular arteries**
- **PT: peritubular capillaries**

Renal Lobe

composed by each pyramid plus the surrounded cortical tissue.

Question 1

- **Urine production**
 - **Remove** metabolic wastes **from blood** by **filtration ?**
 - Regulate the balance between water and electrolytes
 - Re-absorption of water and electrolytes selectively
 - Excretion of urea, uric acid, creatinine etc.
- Secretion of certain enzymes or cytokines
 - Renin
 - Erythropoietin

Key point to answer question 1

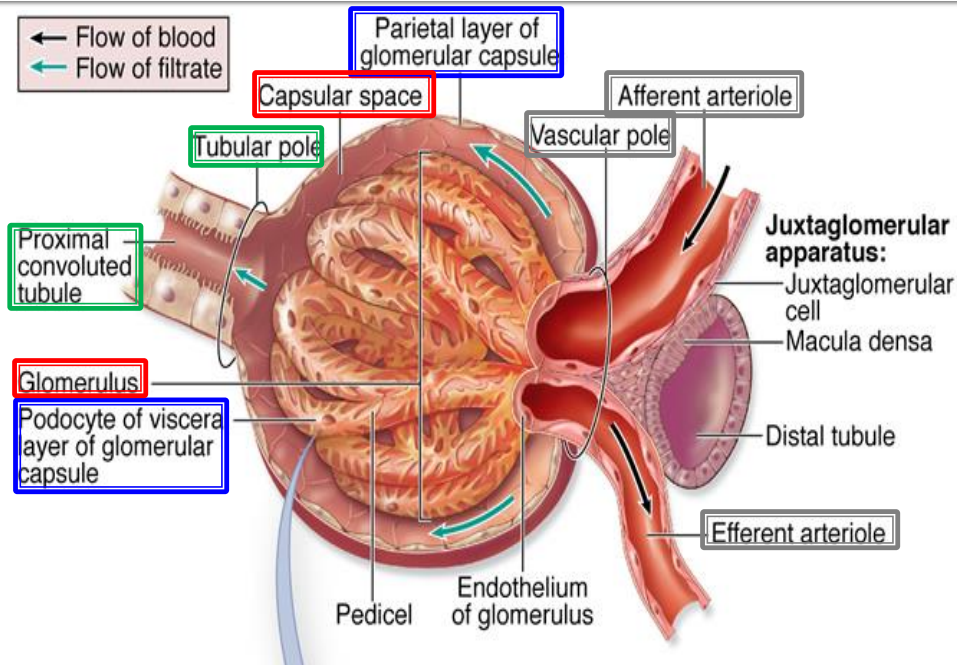

- Elaborate the following contents:
 1. Structure and function of **nephron** and **renal corpuscle**.
 2. Structure and function of **podocyte**, **filtration barrier**, and **mesangial cells**.

The Nephron

- Structural and functional unit [yellow]
- Consists of:
 - **Renal corpuscle (1)**
 - **Proximal convoluted tubule, PCT (2)**
 - **Loop of Henle (3-6)**
 - Thick descending limb, PST (3)
 - Thin segment (4,5)
 - Thick ascending limb, TAL (6)
 - **Distal convoluted tubule, DCT (8)**
- **Cortical** nephron: with short thin segment, it loops **back in outer** medulla region
- **Juxtamedullary** nephron: with long thin segment, it loops **back in inner** medulla region

Renal Corpuscle

- Two poles: **Vascular** & **Tubular**
- Bowman's capsule
 - **Parietal layer**: simple squamous epithelium
 - **Visceral layer**: podocytes
- Glomerulus
 - Tufts of **fenestrated capillaries** closely **surrounded by podocytes** derived from visceral layer of Bowman's capsule
- Bowman's space
 - **Collection** of ultrafiltrate

- **Flow rate: 1300ml/min through renal glomeruli**
- **Glomerular filtrate is formed at a rate of 125ml/min**
- **From this, only 1ml/min of urine is produced**
- **124ml/min is absorbed**

Renal Glomerulus

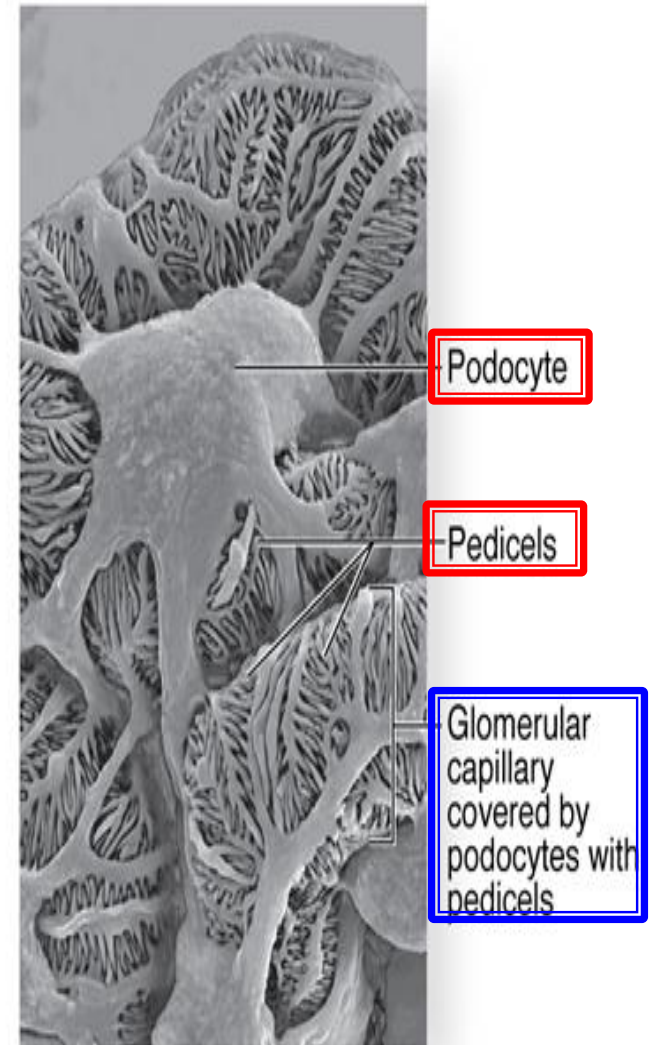

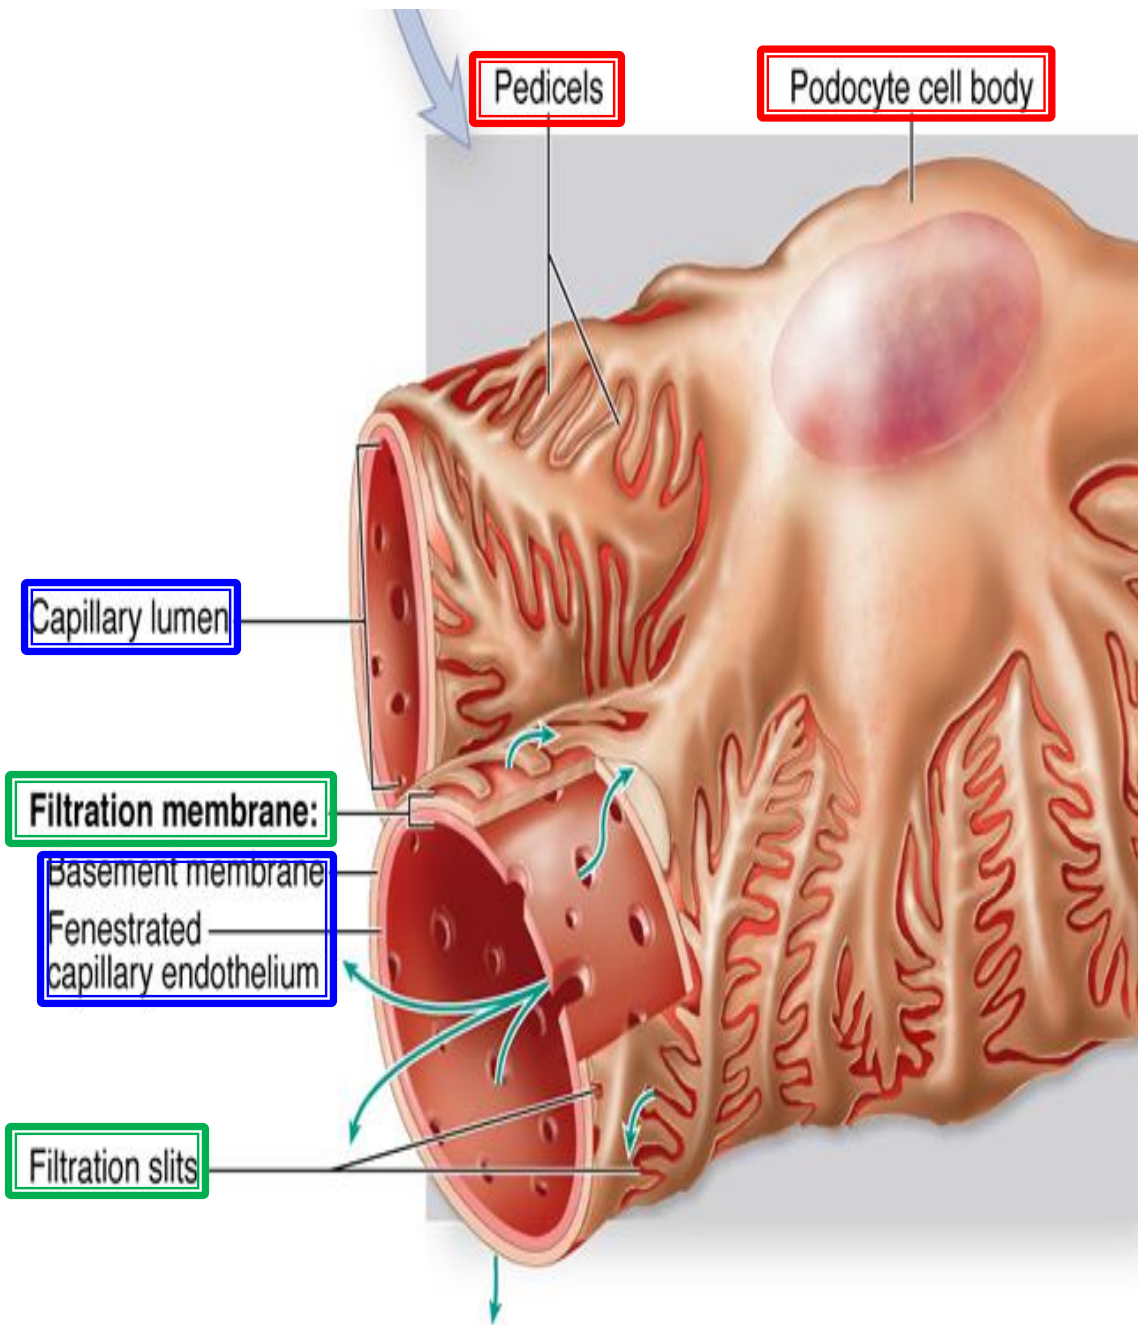

- Derived from **afferent arteriole**
- Drained by **efferent arteriole**
- **Capillaries** are **fenestrated type**
- **Surrounded by podocytes**
- **Mesangial cells**
- **High pressure** coming from the **thicker diameter** of **afferent** compared to efferent arteriole.

Glomerular capillaries, podocytes and mesangial cells

Podocytes:

1. Derived from **visceral layer**
2. Specialized to have **many long cytoplasmic processes**
3. Provide support for **capillaries**
4. Contribute to **filtration barrier**

SEM of Glomerular capillary

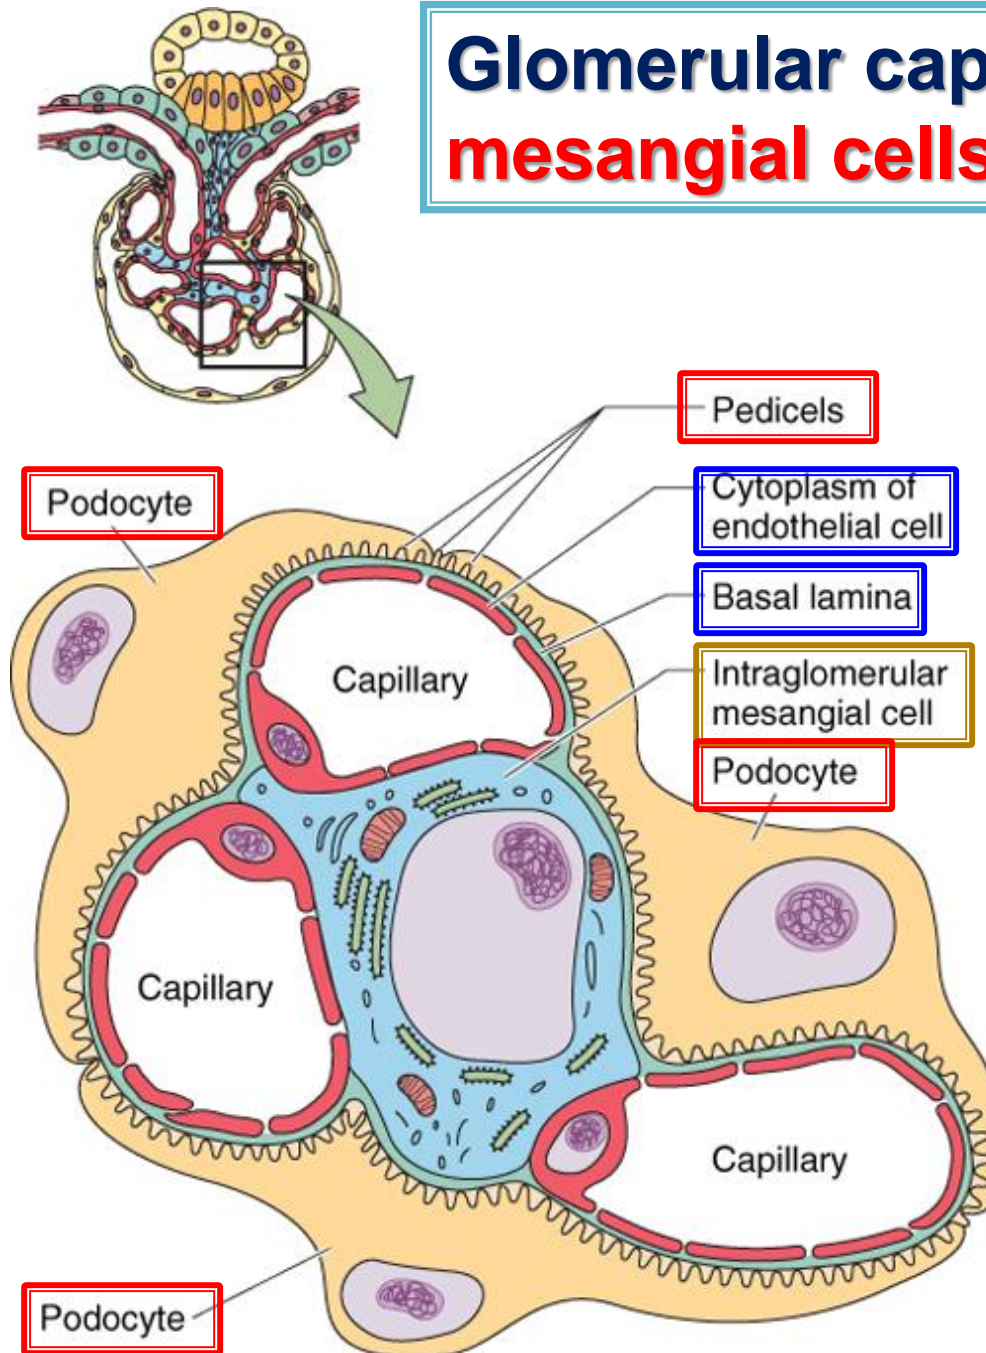

Note:
The close interdigitating nature of foot processes of podocytes is wrapping around the outer surface of the capillary.

Filtration Barrier

1. **Fenestrations of capillary endothelium to block cells**
 2. **Basal lamina, GBM** (fused from basal lamina of endothelium and podocyte), **to restrict large proteins (>70KD) by the meshwork of cross-linked collagen and proteoglycans, and organic ions by negative charges of polyanionic GAGs.**
 3. **Podocyte pedicels (foot processes), filtration slits with diaphragm** (containing nephrin), to restrict small proteins and organic ions.
- **Arrow indicates** direction of filtration

Glomerular capillaries, podocytes and mesangial cells

Mesangial cells:

1. Resemble to pericytes in producing components of external lamina
2. Phagocytic cells
3. Mildly contractile
4. Maintain the wellness of basal lamina (GBM) of glomerulus
5. Cytokine secretion

Glomerular capillaries, podocytes and mesangial cells

Renal Corpuscle

Renal Corpuscle

Functions of Renal Corpuscle

- **Filtration** of blood
- **Glomerular ultrafiltrate**
 - No cells
 - Very little if any proteins
 - Sugars
 - Electrolytes
 - Fluid
- **Collected in Bowman's space**
- **Drained to proximal convoluted tubule (PCT)**

Question 2

■ Urine production

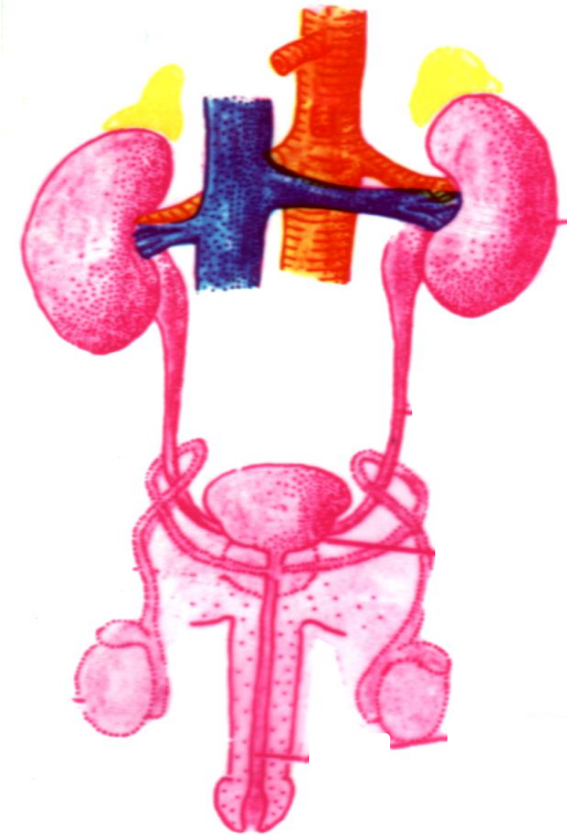

- Remove metabolic wastes from blood by filtration

Renal Corpuscles

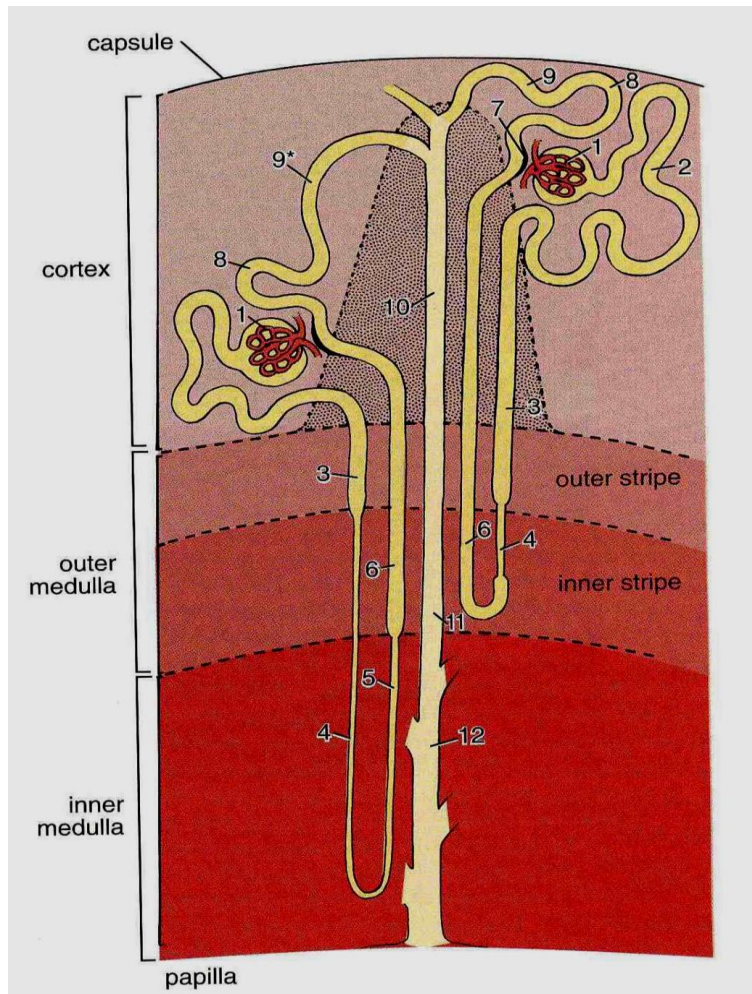

- **Regulate** the balance between water and electrolytes ?
 - **Re-absorption** of water and electrolytes **selectively**
 - **Excretion of** urea, uric acid, creatinine etc.

■ Secretion of certain enzymes or cytokines

- Renin
- Erythropoietin

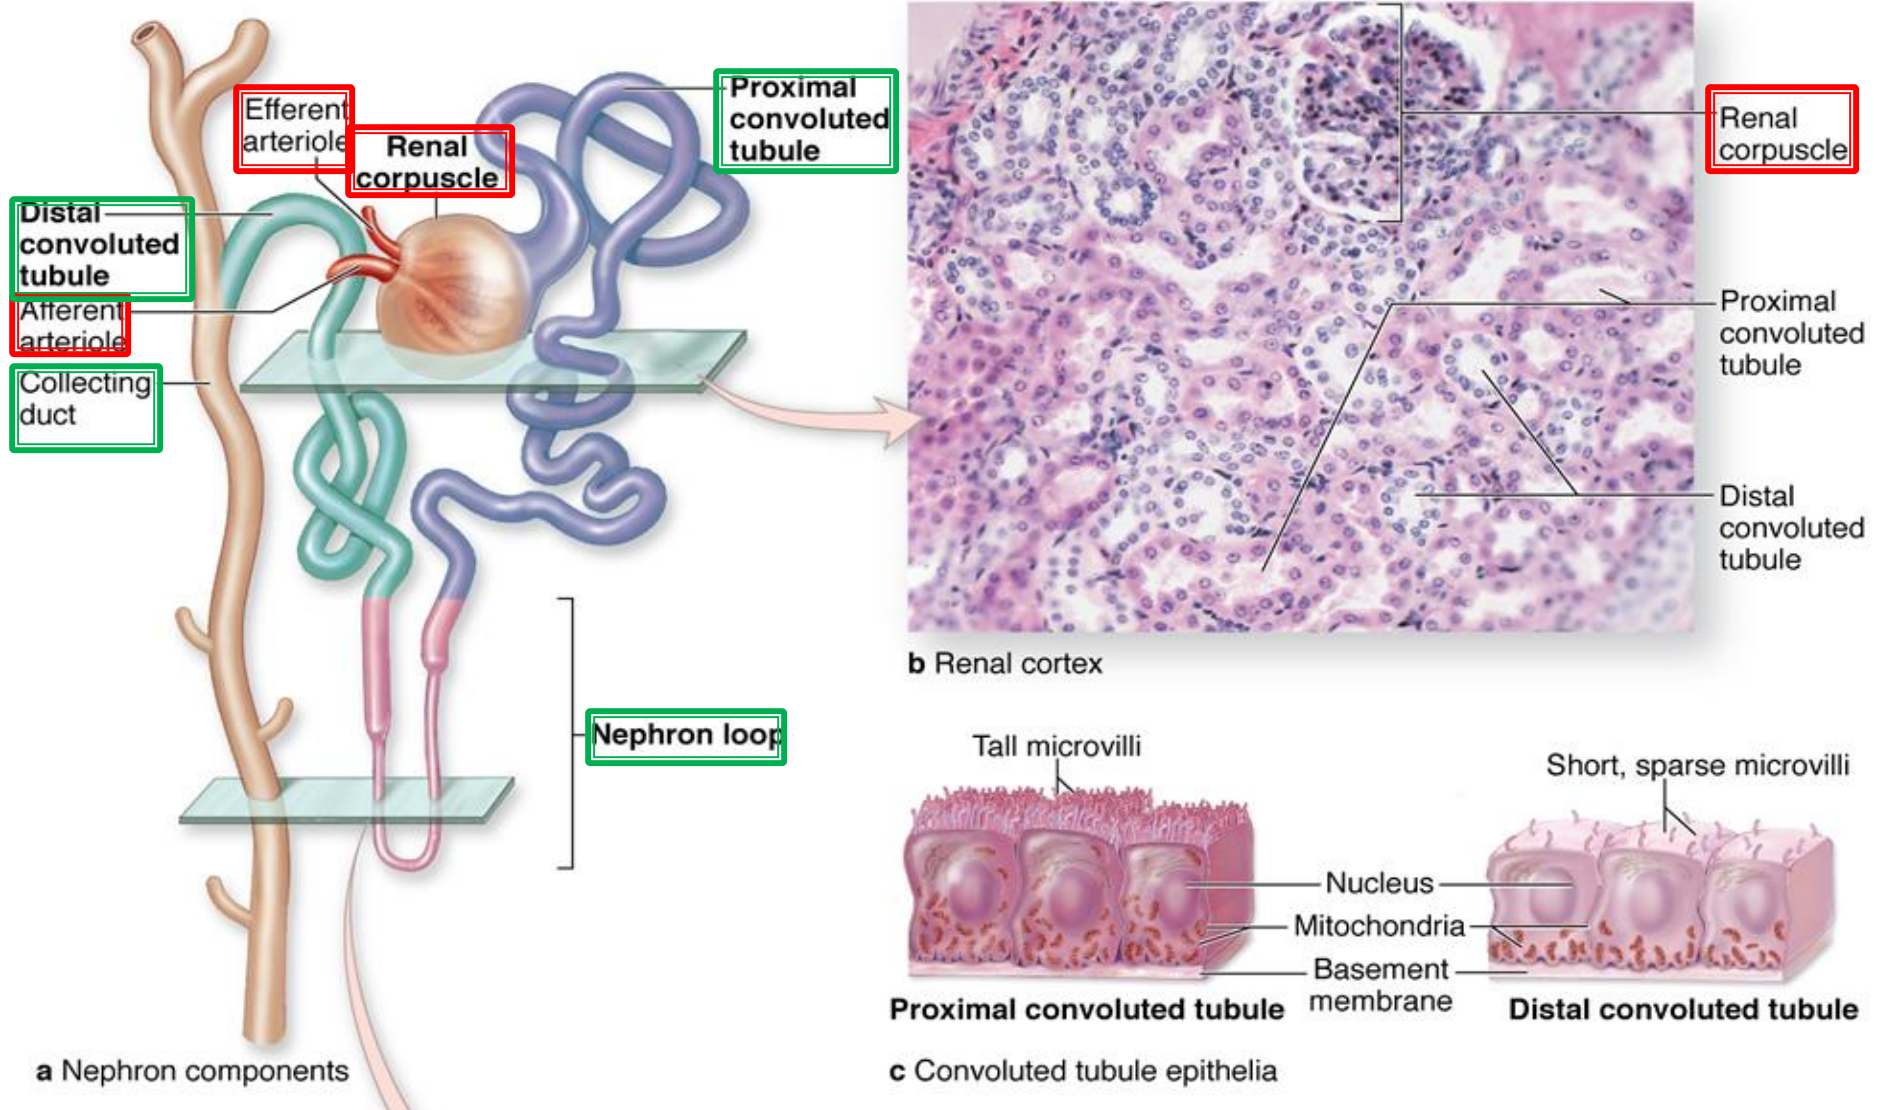

Key point to answer question 2

- **Structure and function of renal tubules.**
 - **Proximal convoluted tubule, PCT (2)**
 - **Loop of Henle (3-6)**
 - Thick descending limb, PST (3)
 - Thin segment (4,5)
 - Thick ascending limb, TAL (6)
 - **Distal convoluted tubule, DCT (8)**
- **Structure and function of uriniferous tubules.**
 - **Renal tubules**
 - **Collecting tubules/ducts**

Nephron Components

Proximal Convolute Tubule, PCT

- **Long and convoluted**, more numerous in XS profile
- Cytoplasm strongly **eosinophilic**
- **Luminal brush border, MV** under EM, increase surface area for re-absorption
- **Basal striations**, basal **infoldings of membrane** and concentration of **mitochondria**
- **No distinctive cell border** due to extensive lateral membrane interdigitations, with channels, aquaporins, for water transport
- Relatively **few nuclei**/cross sectional profile

Proximal convoluted tubules

Functions:

1. Reabsorption of

- fluid, 65%
- Amino acids, proteins
- Sugars and other solutes

2. Excretion of creatinine, etc.

Proximal

Proximal

Distal

Proximal

PCT

Note the
long MV

Lots of
endocytotic
vesicles

microvilli

Proximal convoluted tubule

Peritubular connective tissue

Vessels

Proximal convoluted tubule:

1. Basolateral interdigitations

Proximal Convoluted Tubule, PCT

Distal Convolved Tubule, DCT

- **Shorter than PCT**, thus less numerous in section
- **Cuboidal cells**, more palely stained
- Cells have **no brush border**
- With **more distinctive border**
- Smaller cells, thus more cells per profile
- **Response to aldosterone**
- **Begins distal to macula densa**
- **End of DCT signals end of nephron**

**Distal
Convolved
Tubules**

Proximal

Proximal

Distal

Proximal

Proximal

U6

Distal convoluted tubule

- Basically **no microvilli**, thus smooth luminal border;
- **Basal infoldings** with aquaporins of different types;
- **Nuclei located near luminal border**

Functions of Distal Convoluted Tubules

- **Reabsorption** of
 - Na^+ and secrete K^+
 - bicarbonate ions
- **Secretion** of ammonium
- **Response** to aldosterone from adrenal cortex
 - **Increase** reabsorption of Na^+
 - **Increase** secretion of K^+

Characteristic features of proximal and distal convoluted tubules

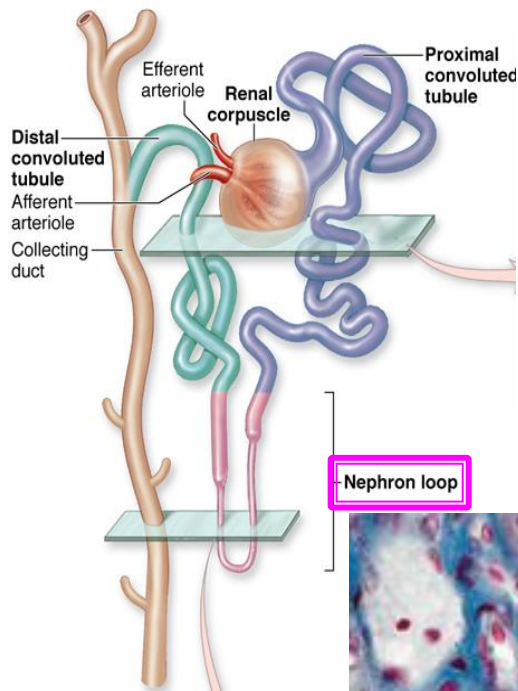

Proximal convoluted tubules

- **Long more** numerous in section
- **Thicker** wall
- **Smaller** lumen
- **Numerous microvilli**
- **Indistinct** cell boundary
- **Acidophilic** cytoplasm
- **Fewer nuclei** per XS of tubule
- Found in cortex
- Basolateral membrane interdigitation
- Numerous mitochondria

Distal convoluted tubules

- **Shorter less** numerous in section
- **Thinner** wall
- **Larger** lumen
- **No brush border/MV**
- **More distinct** cell boundary
- **Less acidophilic** cytoplasm
- **More nuclei** per XS of tubule
- Found in cortex
- Basolateral membrane interdigitation, **less extensive**
- Numerous mitochondria
- **Response to aldosterone**

Nephron Loop

Loop of Henle

- Hairpin shape
- **Thick descending** limb or segment, **similar to PCT**
- **Thin** segment (T), **squamous cells with bulging nuclei**
- **Thick ascending** limb or segment (A), **similar to distal convoluted tubule**
- Re-absorption of fluid through “counter-current” mechanism [working closely with medullary capillary plexus, vasa recta, in the interstitium];
- **Secretion of hyperosmotic urine.**

Loop of Henle

Urineriferous tubule

- **Collecting tubule**
- **Collecting duct**

Collecting tubule

- Similar to DCT, **with larger lumen**
- Response to **ADH** [antidiuretic hormone, vasopressin]
- **Not part of nephron** as they are derived from ureteric bud
- In cortex and in medulla
- **Many in medullary rays**
- Cells with **pale staining cytoplasm**
- Tubules join to and form collecting ducts

Collecting tubules

Medullary ray

Collecting tubules

Medulla

**Capillaries
(vasa recta)**

**Thin segment
of Henle's loop**

Collecting ducts

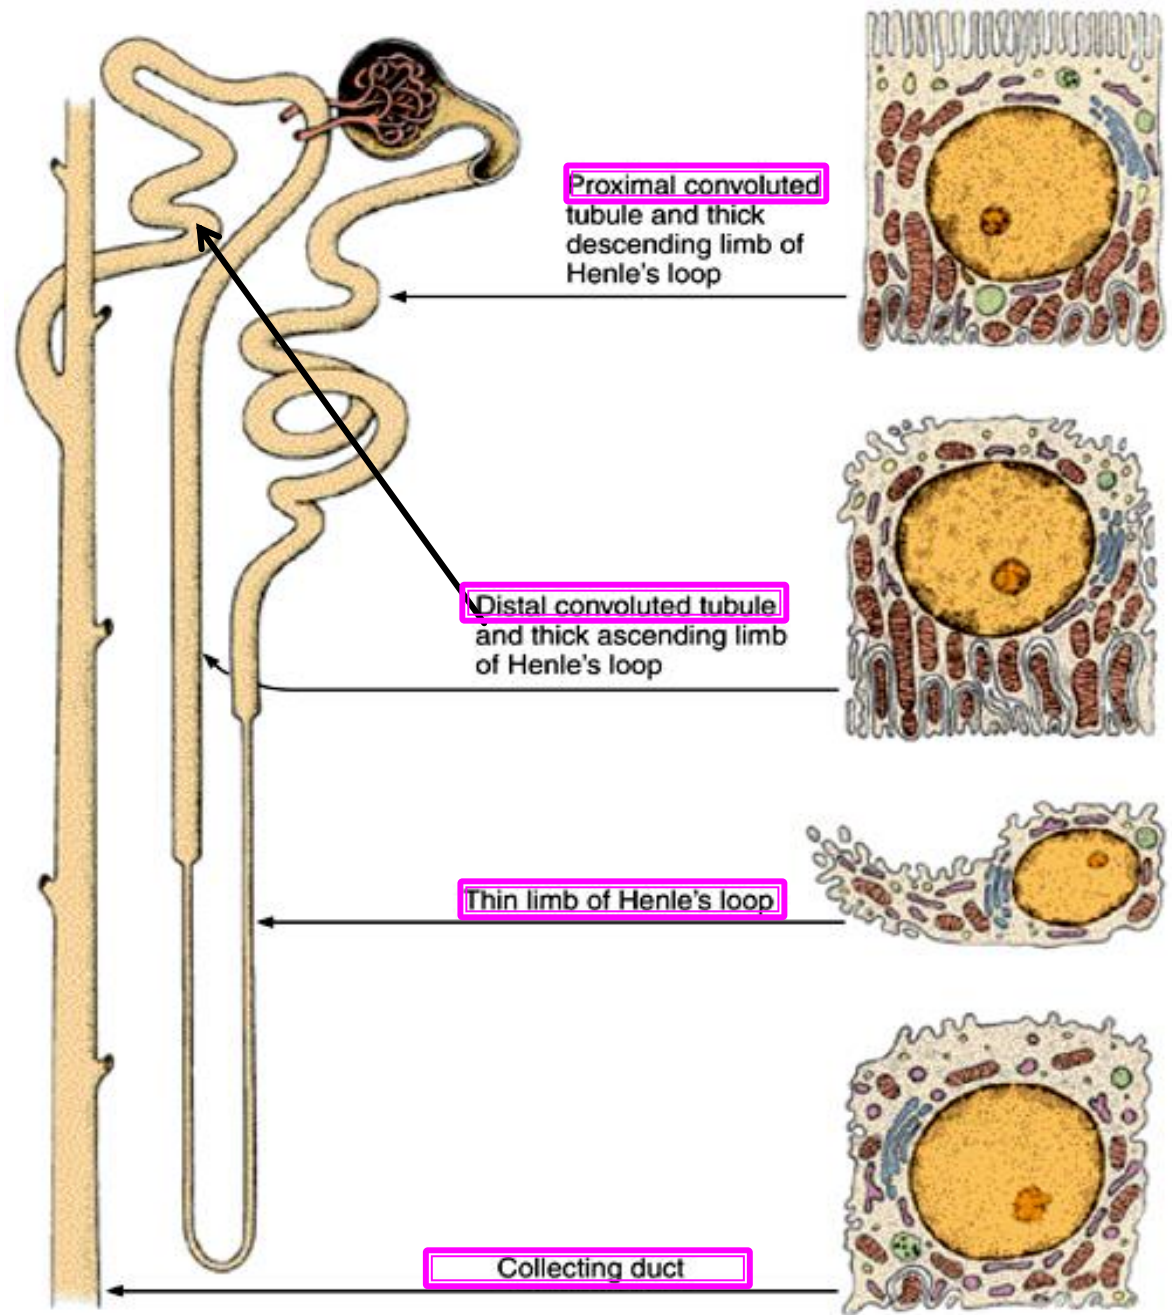

Collecting ducts

Collecting tubule/duct

Structural differences of various segments of uriniferous tubules

Question 3

■ Urine production

- Remove metabolic wastes from blood by filtration

Renal Corpuscles

- Regulate the balance between water and electrolytes
 - Re-absorption of water and electrolytes selectively
 - Excretion of urea, uric acid, creatinine etc.

Renal tubules & collecting tubules/ducts

■ Secretion of certain enzymes or cytokines ?

- Renin
- Erythropoietin

Key point to answer question 3

- Elaborate the following contents:
 - Structure and function of **Juxtaglomerular complex.**
 - Structure and function of **interstitium**

Juxtaglomerular Apparatus

- Located at **vascular pole**
- Consisting of:
 1. **JG cell:** modified muscle cell
 2. **Macula densa**
 3. **Extraglomerular mesangial cells (Lacis cells)**

Juxtaglomerular (JG) cells

1. Modified smooth muscle cells of afferent arteriole
2. Secrete renin (activates angiotensin II)

Macula densa, MD

1. Modified DCT cells
2. With single cilium
3. Sensitive to osmolarity and volume of filtrate
4. Regulates glomerular filtration rate

Afferent arteriole

Lacis cell, L

1. Extraglomerular mesangial cells
2. Function not well understood
3. Involved in phagocytosis, maintenance of GBM
4. secrete growth factors

Efferent arteriole

Juxtaglomerular Apparatus and Functions

Macula Densa, MD

1. **Modified DCT cells**
2. **With single cilium**
3. **Smaller and regularly arranged**
4. **Cells with reversed polarity**

Macula Densa, MD

↓ : Thick basement membrane of glomerular capillaries

▽ : MD

JG cells

JG cells with secretory granules

JG apparatus

JG apparatus

- Macula densa, **MD**
- **JG** cells with secretory granules (renin)

Interstitial tissue

- Located between renal tubules and vessel network
- **Fibroblast-like cells**
- **Synthesize collagen**
- Secrete erythropoietin (?)

SUMMARY 1

■ Urine production

- Remove metabolic wastes from blood by filtration

Renal Corpuscles

- Regulate the balance between water and electrolytes
 - Re-absorption of water and electrolytes selectively
 - Excretion of urea, uric acid, creatinine etc.

Renal tubules & collecting tubules/ducts

■ Secretion of certain enzymes or cytokines

- Renin: **Juxtaglomerular (JG) cells**
- Erythropoietin: **interstitial cells**

Ureter

Ureter

a Ureter cross section

b

Urinary bladder

a

b

Urothelium

Collapsed

Distended

Transitional epithelium

Large superficial (facet or umbrella) cells with two nuclei

Urothelium

- Giant superficial (facet or umbrella) cells
- To enable them to stretch
- To withstand high tonicity urine
- With specialized luminal membrane

Summary 2

- **Lobes vs lobules** of kidney
- **Nephron** structure and function
- **Urineriferous tubules** and function
- **JG apparatus** and function
- Ureter/bladder and urothelium and its **membrane specialization**

End

Review questions

- What is a **nephron**?
- What constitutes the **filtration barrier**?
- Summarize the histological features of the **renal tubules** in the form of a table.
- What constitutes the **JG apparatus**? What is its function?
